Try it for yourself

[Here's](#) the notebook that Laurence was using in that screencast. To make it work quicker, go to the 'Runtime' menu, and select 'Change runtime type'. Then select GPU as the hardware accelerator!

Work through it, and try some of the exercises at the bottom! It's really worth spending a bit of time on these because, as before, they'll really help you by seeing the impact of small changes to various parameters in the code. You should spend at least 1 hour on this today!

Once you're done, go onto the next video and take a look at some code to build a convolution yourself to visualize how it works!
